

This does not pass only the first string. It passes the address of the first element of the array, which is enough to access all remaining elements because they are stored contiguously.

The Most Important Concept

The expression `&week[0]` points to the first pointer in the array, not to the first character.

Because the pointers are stored contiguously, starting from `&week[0]` you can access the whole array:

```

(&week[0])[0] // week[0]
(&week[0])[1] // week[1]
(&week[0])[2] // week[2]

```

Type summary

```

week      -> char *[7]
week[0]   -> char *
week[0][0] -> char ('M')
&week[0]  -> char **

```
